

CROWNS, BRIDGES, VENEERS

Crowns cover most or all of a tooth, and a bridge is attached to two or more crowns to fill the space where a tooth is missing. A veneer is a thin, tooth-colored piece cemented onto the front of a tooth. They can improve the look of stained or badly shaped teeth and close small spaces or gaps between teeth.

Dental work like bridges and crowns can be challenging to keep clean. The Waterpik® Water Flosser is designed to clean around all types of dental work and restorations. The pulsating action helps clean under the bridge and around crowns where bacteria and food can get trapped. And the new Plaque Seeker™ Tip provides additional plaque removal around all types of dental work.
